Uncertainty and conspiracy belief: a test article

Anna Kowalska and Jan Nowak. Journal of Test Results, 26(6), 538-540. https://doi.org/10.9999/test.2017.001

Abstract. We measured conspiracy belief in a correlational survey of 412 adults in Poland. Uncertainty was positively associated with conspiracy belief, r = .32. We did not manipulate uncertainty.

Method. Participants (N = 412; 58% women) completed the Generic Conspiracist Beliefs scale. This study was correlational; no causal conclusions can be drawn from these data.

Results paragraph 0. Belief in conspiracy theories was higher among participants who reported more uncertainty about the future. Results paragraph 0. Belief in conspiracy theories was higher among participants who reported more uncertainty about the future.

Results paragraph 1. Belief in conspiracy theories was higher among participants who reported more uncertainty about the future. Results paragraph 1. Belief in conspiracy theories was higher among participants who reported more uncertainty about the future.

Results paragraph 2. Belief in conspiracy theories was higher among participants who reported more uncertainty about the future. Results paragraph 2. Belief in conspiracy theories was higher among participants who reported more uncertainty about the future.

Results paragraph 3. Belief in conspiracy theories was higher among participants who reported more uncertainty about the future. Results paragraph 3. Belief in conspiracy theories was higher among participants who reported more uncertainty about the future.

Results paragraph 4. Belief in conspiracy theories was higher among participants who reported more uncertainty about the future. Results paragraph 4. Belief in conspiracy theories was higher among participants who reported more uncertainty about the future.

Discussion. Perhaps conspiracy theories could reduce anxiety in the long run, but we did not test this speculation. Interestingly, an extraordinarily-long-hyphenated-compound-word-for-testing appears here.
